

BASIC 6 TREATMENT LAWN CARE PROGRAM

EARLY SPRING

Fertilizer- An early light application of food to help wake up the turf and supply a balanced diet for healthy growth. We are careful not to over stimulate the turf, which would do more harm than good when summer stresses arrive.

LATE SPRING

Fertilizer- A light feeding to ensure a steady food supply for healthy growth without over stimulating the turf.

Weed Control- Applied as need to clean up any newly germinating weeds.

Crabgrass Control- Applied now to ensure control of this annual problem grass.

EARLY SUMMER

Fertilizer- A light feeding to ensure a steady food supply for healthy growth without over stimulating the turf.

Insect control- Applied as needed to control and prevent summer type insects from damaging the turf.

Grub Control- The newest products to control this problem pest are applied at this time, they take several week to become active in the soil profile and are effective for a considerable length of time.

SUMMER

Fertilizer- A light feeding to ensure a steady food supply for healthy growth without over stimulating the turf.

Insect control- Applied as needed to control and prevent summer type insects from damaging the turf.

EARLY FALL

Fertilizer- This period marks a significant change in turf grass functions. A generous supply of food is applied at this time to begin the repair of any summer stresses and to start the rebuilding of roots for next spring. A healthy lawn starts in this fall period- not in the spring, as most people believe.

Weed Control- Applied as needed to control any summer or early fall germinating weeds.

LATE FALL

Fertilizer- A special blend of fertilizer and nutrients to continue root development and soil building.
