

ORGANIC-BASED LAWN CARE PROGRAM

EARLY SPRING

A very special application of organic fertilizer with unique materials that supply complete feeding and root development, along with soil building & conditioning.

Your lawn needs a "wake-up" feeding along with root development; your soil has been loosened naturally with the alternate freezing & thawing. Seeding to repair winter damage if ordered.

SPRING

Fertilizer; Secondary & Micro Nutrients; Natural Soil Conditioners; Root Stimulants; Natural Thatch Control are applied.

Weed Control and Pre-emergent Crabgrass Control are applied as needed.

We are preparing your lawn for the stress of summer.

EARLY SUMMER

Light Fertilizer; Secondary & Micro Nutrients; Natural Soil Conditioners; Root Stimulants; Natural Thatch Control are applied.

Insect and Grub Controls are applied as needed.

At this time the turf may be starting to feel the stress of summer. We try to keep it growing enough to "grow out" of disease problems, yet not too fast which weakens it and invites disease outbreaks. Continuous Aeration means more of the water applied will go into the root zone, saving time, effort and money.

SUMMER

Light Fertilizer; Secondary & Micro Nutrients; Natural Soil Conditioners; Root Stimulants; Natural Thatch Control are applied.

Insect Control applied as needed.

Close attention during this time of the season helps ward off problems.

Any seeding repairs should be evaluated at this time and scheduled if needed.

EARLY FALL

Heavy application of fertilizer; Secondary & Micro Nutrients; Natural Thatch Control; Natural Aeration; Root stimulants & developers.

Spot weed control applied as needed.

Your lawn has probably experienced a lot of stress. Fertilizing gives it the fuel it needs to recover- but only because of the organic materials that are also applied. Summer weeds can finally be controlled; repairs can be done to the turf if ordered.

FALL

A very heavy application of organic fertilizer with unique materials that supply complete feeding and root development, along with soil building & conditioning.

This is an essential period in the season for your lawn. It is the best time of the year to effectively promote root development because the turf plant is naturally programmed to slow top growth and focus on root growth. Organic materials foster rooting and promote soil improvement during the winter months.
